

Local setup — terminal commands

Copy-paste guide to run **Silverleaf Lesson Plans** on your machine after unzipping the project. Works on **Mac** and **Linux**.

Requires **Node.js** ≥ 22.6 .

1. Install Node.js 22 (one time)

Mac — using nvm (recommended)

```
curl -o- https://raw.githubusercontent.com/nvm-sh/nvm/v0.40.1/install.sh | bash
```

Close Terminal, open it again, then:

```
source ~/.nvm/nvm.sh
nvm install 22
nvm use 22
nvm alias default 22
node -v
npm -v
```

You should see `v22.x.x`.

Mac — using Homebrew (if you already use brew)

```
brew install node@22
brew link node@22 --force --overwrite
node -v
```

2. Go to the project folder

After unzipping:

```
cd ~/Downloads/silverleaf-lesson-plans-main
```

Change the path if you extracted the zip somewhere else.

3. First-time setup (one time per machine)

```
npm install
npm run db:seed
```

- `npm install` — downloads dependencies (~1-2 minutes).
- `npm run db:seed` — creates the local database and demo lesson plans.

Important: do not run `db:seed` while `npm run dev` is already running. Stop the dev server first (`Ctrl + C`), then seed.

Optional — load the textbook corpus (slow):

```
npm run db:import-textbooks
```

4. Start the app (every time you work)

```
cd ~/Downloads/silverleaf-lesson-plans-main
source ~/.nvm/nvm.sh      # skip if you don't use nvm
nvm use 22                # skip if node -v already shows v22+
npm run dev
```

Wait until you see:

```
✓ Ready
Local: http://localhost:3000
```

Keep this Terminal window open. Closing it stops the server and localhost will not load.

Open in your browser:

<http://localhost:3000/en/sign-in>

(or <http://localhost:3000> — shows the sign-in screen when logged out)

5. Sign in (demo — no password)

Role	Email	Staff ID
Teacher	teacher@silverleaf.co.tz	any non-empty value, e.g. 12345
Admin	hr@silverleaf.co.tz	any non-empty value, e.g. 12345

There is **no password**. Locally, the Staff ID is not checked — only the email must match a seeded account.

Full copy-paste block (first run)

```
source ~/.nvm/nvm.sh && nvm install 22 && nvm use 22
cd ~/Downloads/silverleaf-lesson-plans-main
npm install
npm run db:seed
npm run dev
```

Then open <http://localhost:3000/en/sign-in>.

Every day after that

```
cd ~/Downloads/silverleaf-lesson-plans-main
source ~/.nvm/nvm.sh && nvm use 22
npm run dev
```

Troubleshooting

Browser says “connection failed” or page won’t load

The dev server is not running. Run `npm run dev` and wait for `✓ Ready`.

Check from Terminal:

```
curl -I http://localhost:3000
```

If you see `Connection refused`, start the server again.

bad option: --experimental-strip-types

Node is too old. Switch to Node 22:

```
source ~/.nvm/nvm.sh
nvm install 22
nvm use 22
node -v
```

Then run `npm run db:seed` and `npm run dev` again.

Port 3000 already in use

Find what is using it (Mac):

```
lsof -i :3000
```

Stop that process, or run on another port:

```
npm run dev -- -p 3001
```

Then open <http://localhost:3001/en/sign-in>.

Reset the database

Stop the dev server (`Ctrl + C`), then:

```
npm run db:reset
npm run dev
```

Verify the project (optional)

```
npm run typecheck && npm run lint && npm run test
```

No `.env` required for basic local use

The app uses embedded PGLite (local database) and demo auth by default. Copy `.env.example` to `.env.local` only if you want AI Studio (`OPENROUTER_API_KEY`).
